Peering Connection From Different Account

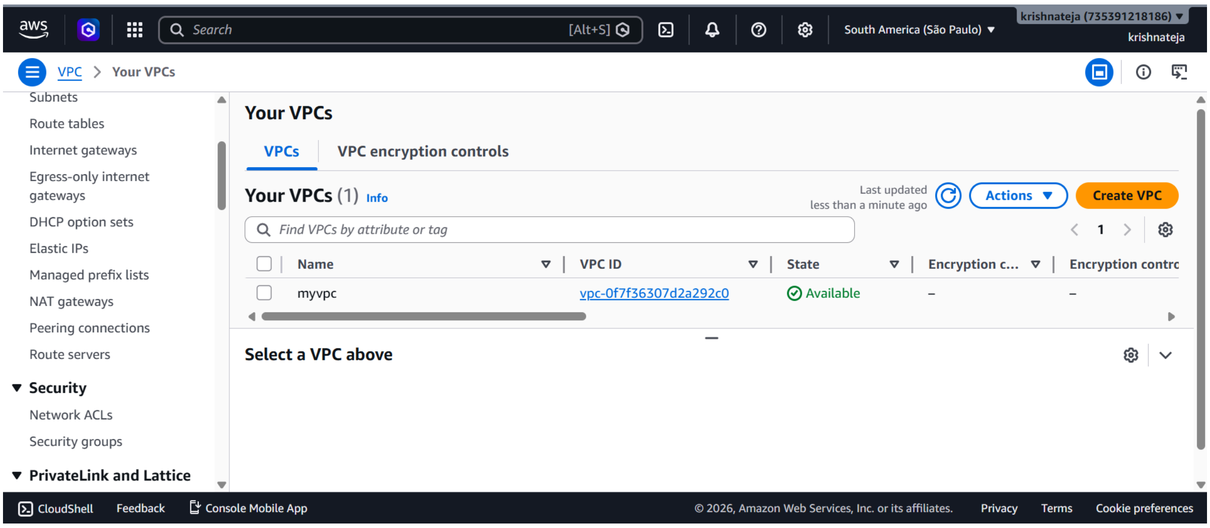
OverView:

VPC Peering Between Different AWS Accounts

- VPC Peering is a connection between two VPCs that allows them to communicate privately.
- The VPCs can be in **different AWS accounts** or even different regions.
- Traffic between the VPCs stays on the **AWS network** and does not use the public internet.
- One account sends a **VPC peering request**.
- The owner of the other account **accepts the request**.
- After acceptance, both accounts must update their **route tables** to send traffic through the peering connection.
- Security Groups and Network ACLs must allow the required traffic.

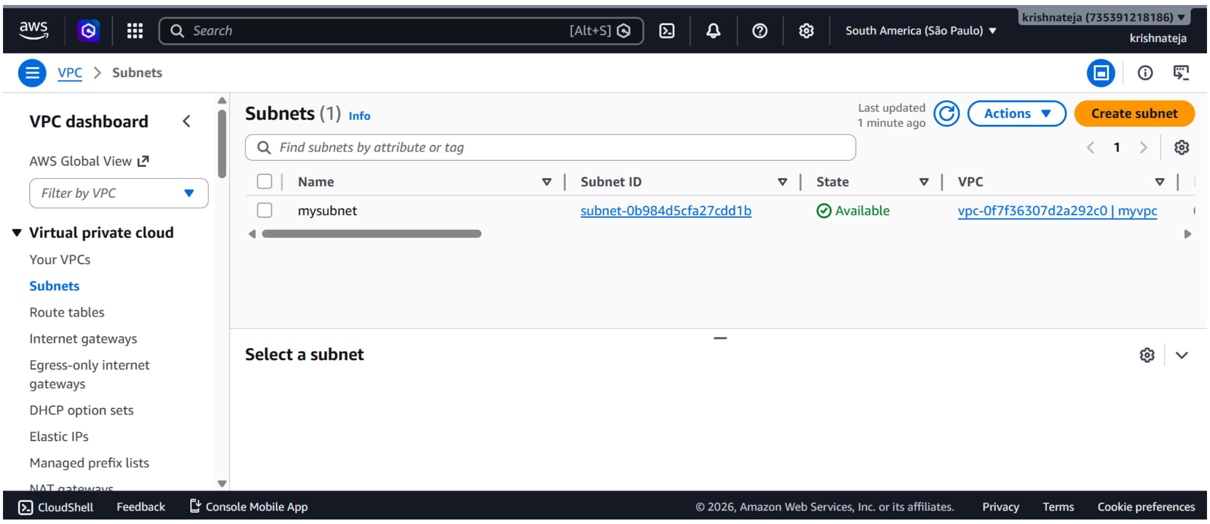
Step 1:

Create Vpc In my AWS Account.



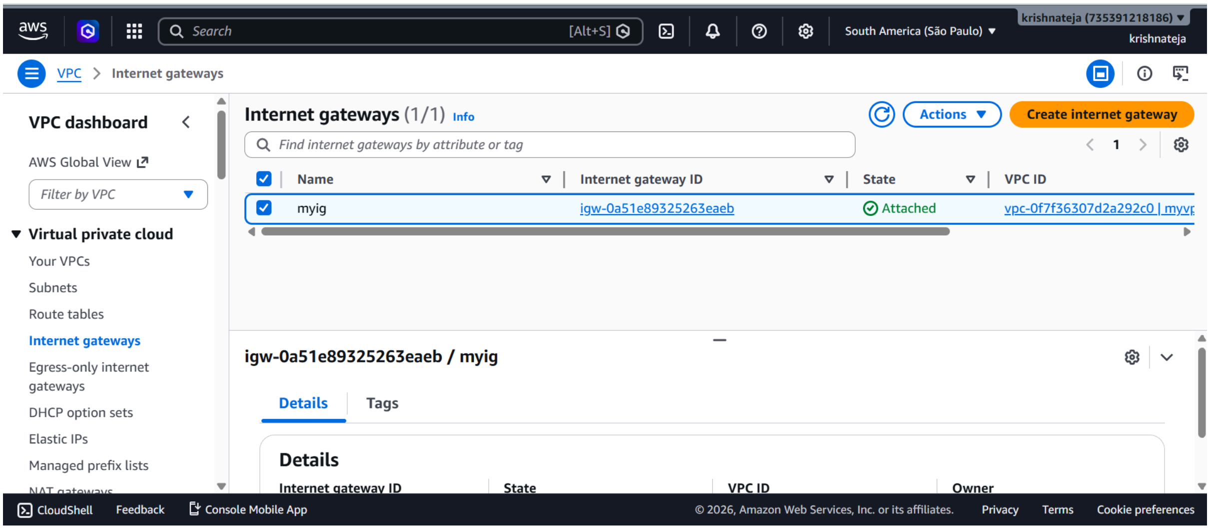
Step 2:

Create Subnet In My AWS Account.



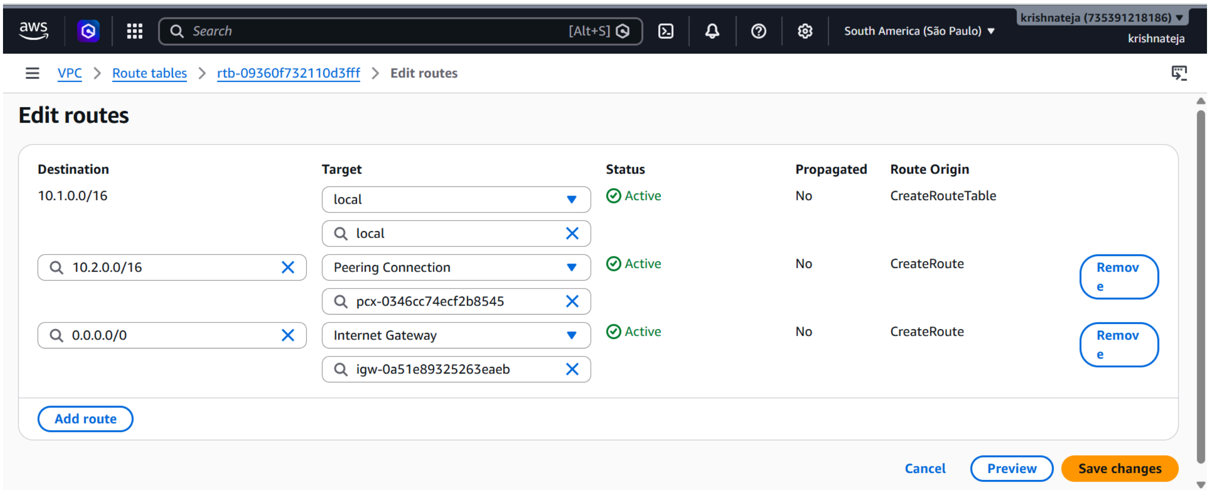
Step 3:

Create Internet Gateway In My AWS Account.
After Creating the IG Attached to VPC.



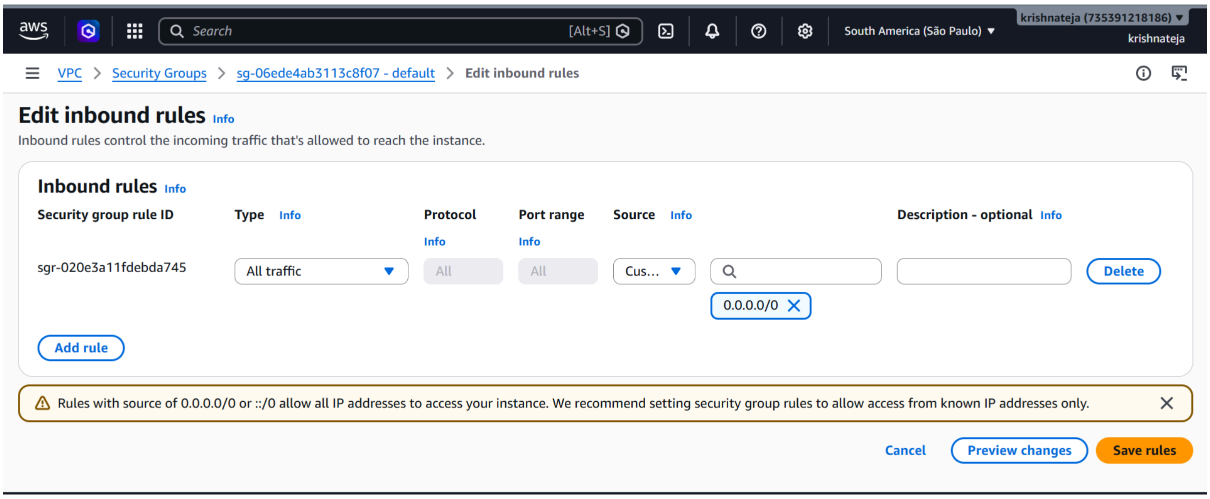
Step 4:

Edit Default Route Table.
Add Internet Gateway in Route Table like (0.0.0.0/0 - InternetGatewayID).



Step 5:

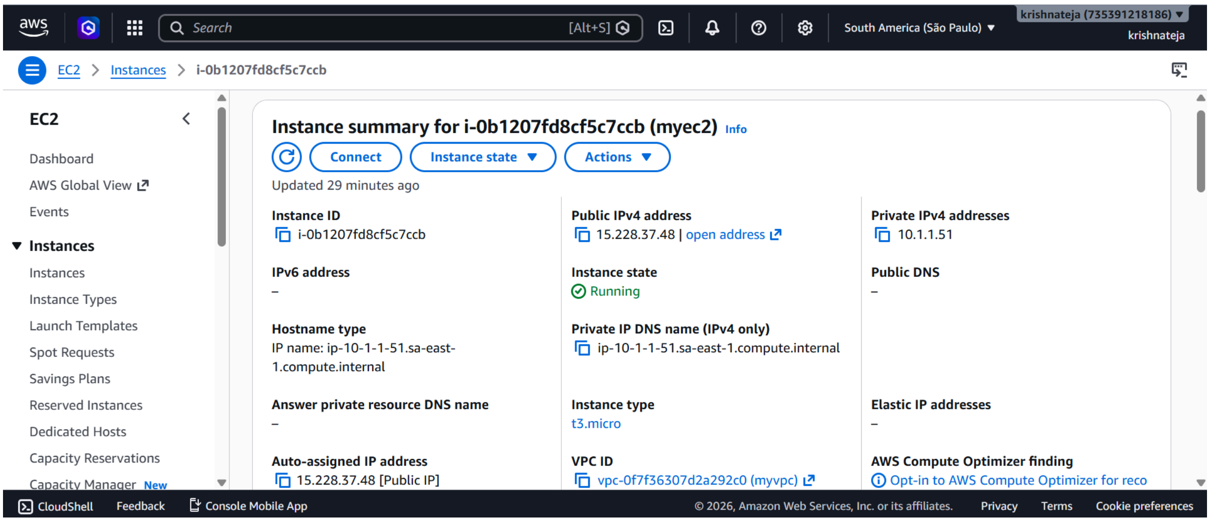
Edit Default Security Tables InBound Rules→like delete all traffic and add All traffic.



Step 6:

Create EC2 machine.

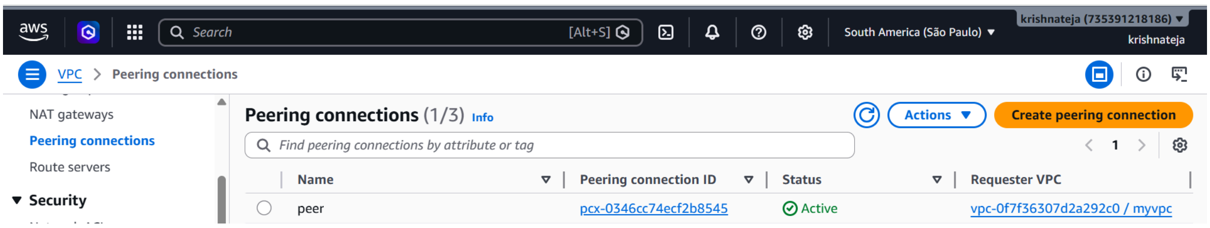
Link VPC And Link Subnet and Enable Public Address.



Step 7:

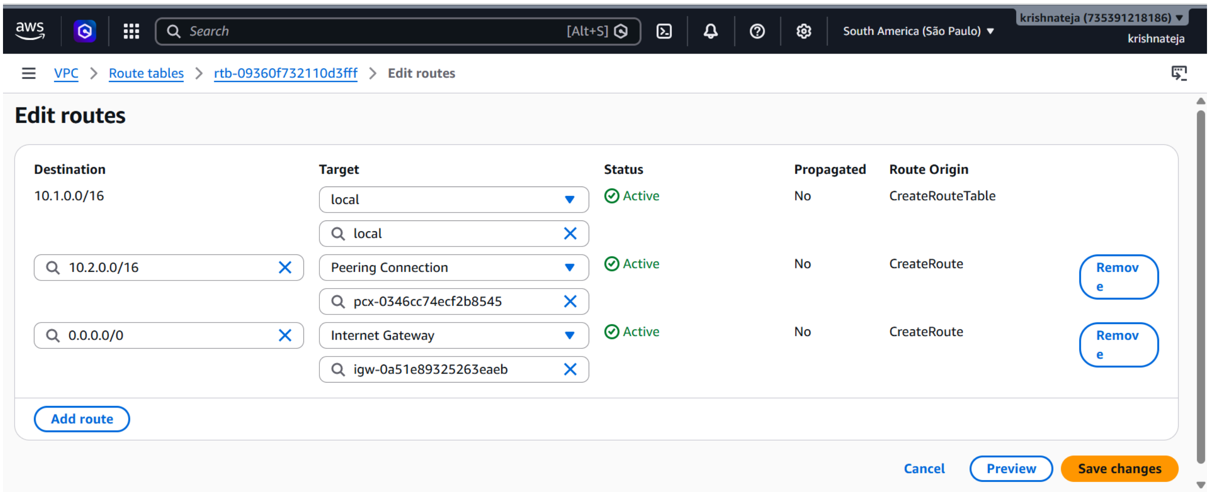
Create Peering Connection From My Account to Other Account.

Add Other Account ID and Region and Vpc ID.



Step 8:

Edit Default Route Tables add Other Account Vpc IPV4 Address and select Peering Connection.



Step 9:

Connect To EC2 Machine.
Type Command like sudo su and apt update
Next Type Command ping 10.2.1.60 (Other Account Ec2 Machine IPV4).

The Final Result is:
