

Terraform Commands:

terraform version: Displays the installed Terraform version.

terraform init: Initializes the Terraform project by downloading the required providers and creating the .terraform directory.

terraform validate: Checks whether the Terraform configuration syntax is correct.

terraform plan: Shows what changes Terraform will make before applying them. No resources are created.

terraform apply: Creates or updates infrastructure based on the Terraform configuration.

terraform apply --auto-approve: Applies changes without asking for confirmation.

terraform destroy: Deletes all infrastructure managed by the current Terraform configuration.

terraform destroy -auto-approve: Deletes infrastructure without asking for confirmation.

terraform show: Displays the current Terraform state or execution plan.

terraform output: Displays the output values defined in outputs.tf.

terraform providers: Lists the providers used in the current project.

terraform state list: Lists all resources stored in the Terraform state file.

terraform workspace list: Lists all Terraform workspaces.

terraform workspace new <name>: Creates a new workspace.

terraform workspace select <name>: Switches to another workspace.

terraform workspace show: Displays the current workspace.

terraform workspace delete <name>: Deletes a workspace.

terraform graph: Generates a dependency graph of the infrastructure.

terraform login: Authenticates Terraform with Terraform Cloud.

terraform logout: Logs out from Terraform Cloud.
